Zero-skew merge

Deferred-merge embedding equalizes delay so opposite arms arrive together

The idea

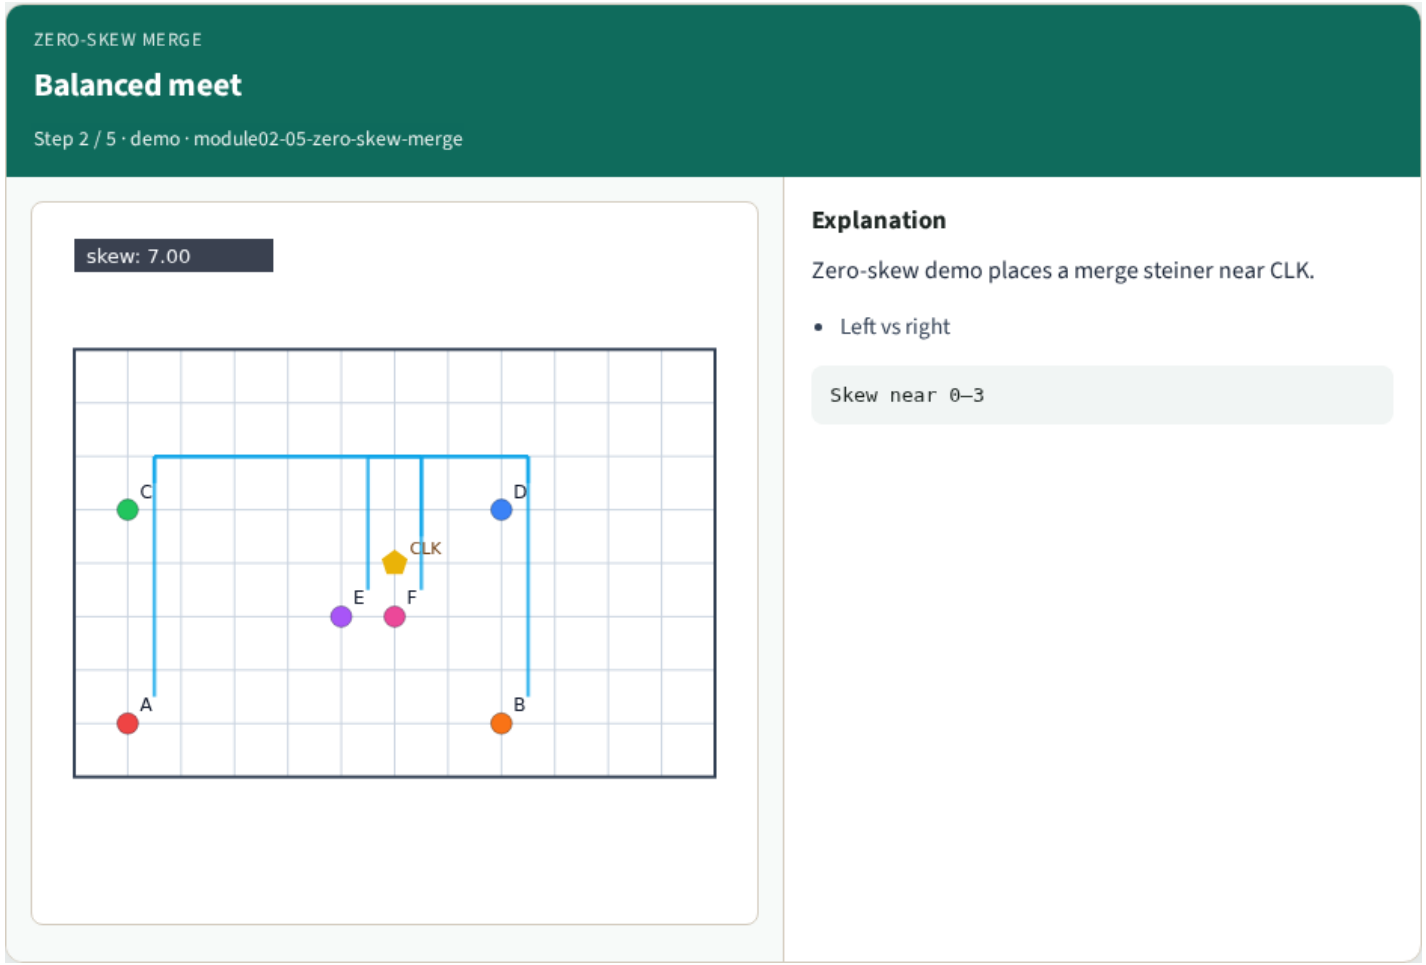

- Partition sinks left and right of the source
- Choose a meeting steiner so left radius plus wire matches right radius plus wire
- That is the zero-skew intuition

Toy only

ZERO-SKEW MERGE

Toy only

Step 5 / 5 · limit · module02-05-zero-skew-merge

Explanation

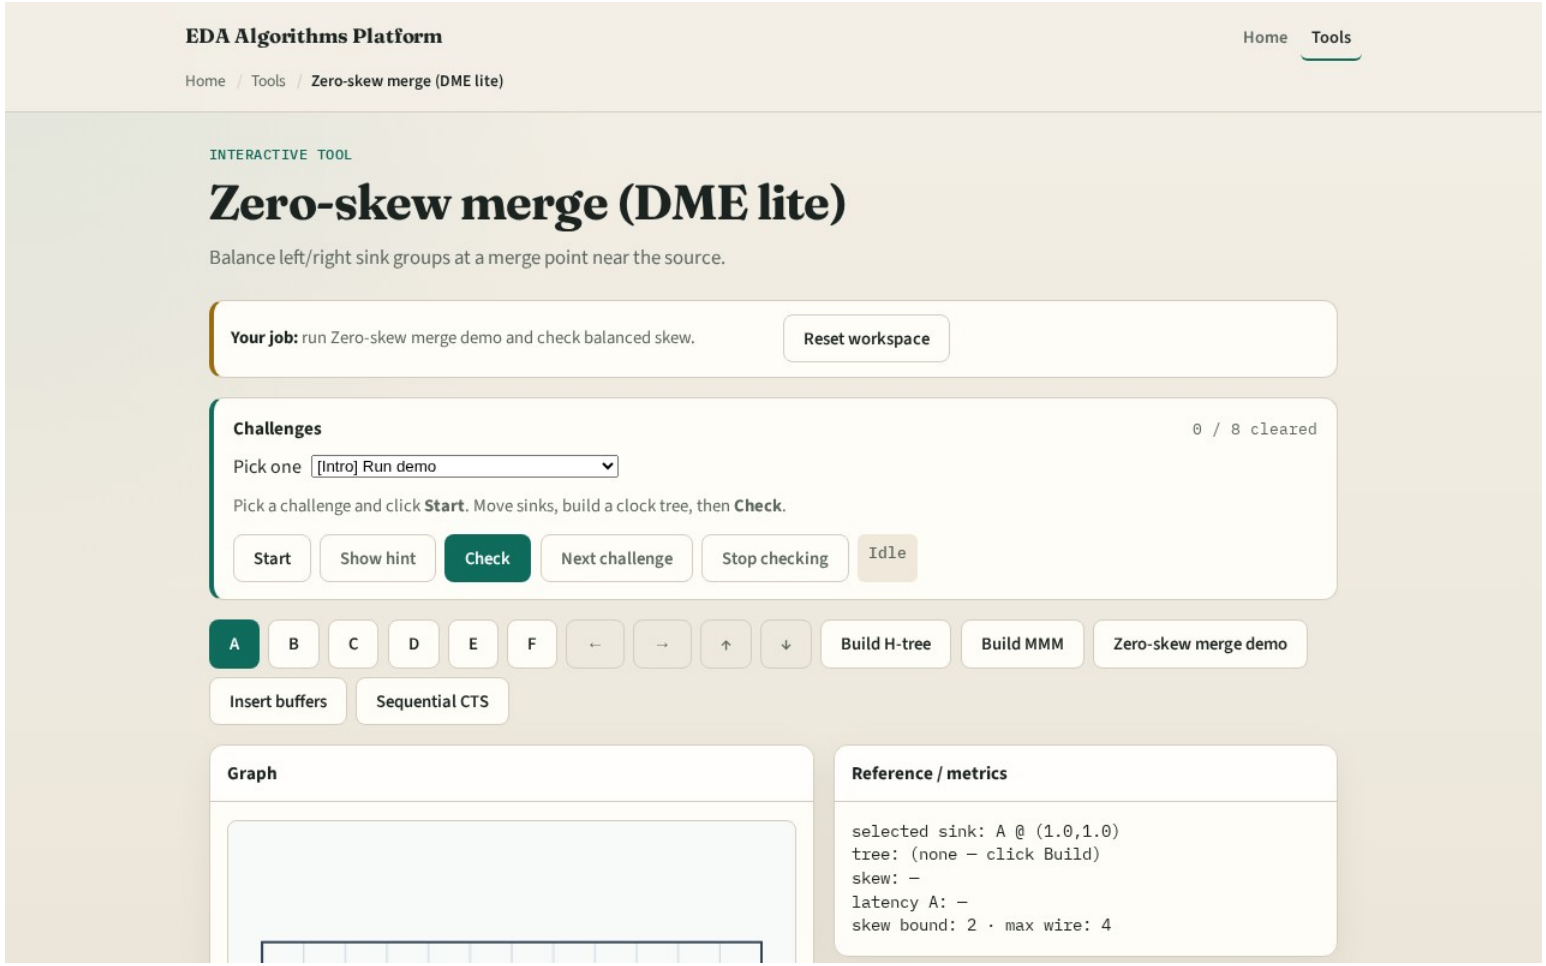

Full DME embeds delay recursively on every merge — this lab is the intuition.

- Not full DME
- Buffering next

```
Skew bound lab
```

Toy only

Browser lab track

Browser lab starter

Implement track

- Call `zero_skew_merge(a,b,da,db)` for a 1D pair; run the browser demo for the full chip
- Assert $|la - lb| \approx 0$ for equal da,db

Pitfalls

- Balancing Euclidean radii
- Ignoring existing subtree delay da/db
- Expecting full industrial DME from this toy

Your turn

- Next: tapping points where the tree forks
