Welcome

After SPICE you still need electrical rules , floating gates, multi-drive, supply shorts, wells

The idea

- Toy tiny_erc: INV/BUF/SHORT + bad nwell → 5 ERC markers

Two tracks

- Implement track uses common/ solvers; browser lab track uses platform tools

Toy netlist

- Tiny_erc: u1 INV, u2 INV on float_n, u3 BUF fighting z, short1 vdd ↔ vss, bad nwell

Path

- Graph → drivers → floating → undriven → multi → shorts → wells → markers → engine

Begin

- Next: netlist connectivity graph
