Boolean

Boolean patterns combine coverage predicates across layers (AND / OR / AND-NOT)

The idea

- V covered by M1 and not by M2 → and_not hit
- GOLDEN boolean_and_hits=1

Cover M1

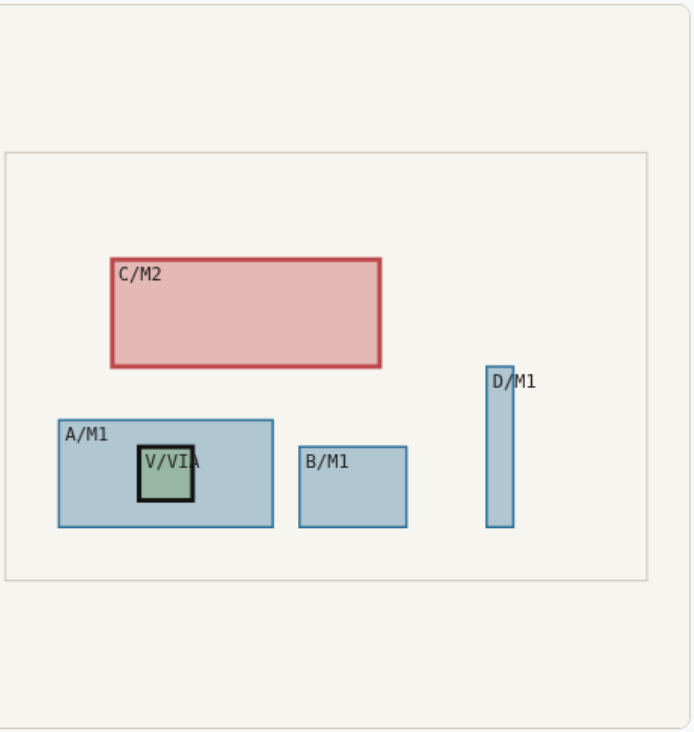

Cover M1

Cover M2

LAYERED BOOLEAN

Cover M2

Step 2 / 5 · m2 · module03-05-layered-boolean

Explanation

V is not covered by M2 C.

- ¬M2

```
false
```

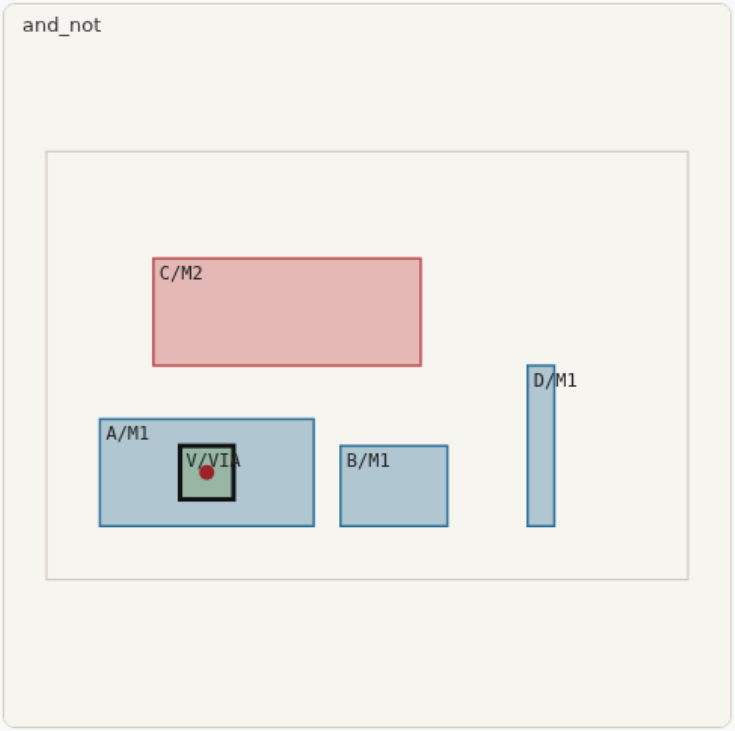

Cover M2

And-not

LAYERED BOOLEAN

And-not

Step 3 / 5 · andnot · module03-05-layered-boolean

Explanation

and_not = M1 ∧ ¬M2 matches V.

- and_not

```
hit
```

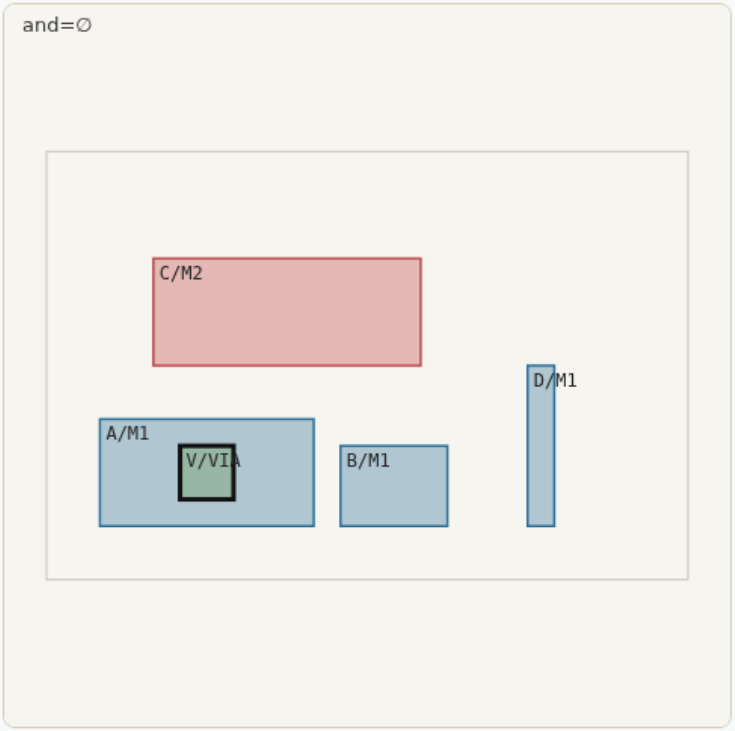

And-not

And

LAYERED BOOLEAN

And

Step 4 / 5 · and · module03-05-layered-boolean

Explanation

and = M1 ∧ M2 matches none on the toy.

- and

```
∅
```

And

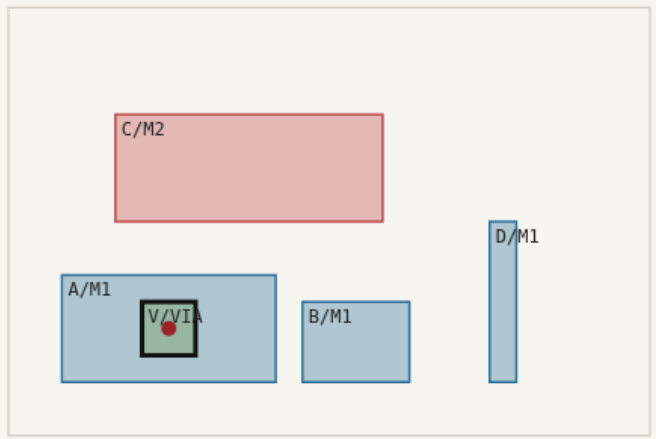

Hit

LAYERED BOOLEAN

Hit

Step 5 / 5 · hit · module03-05-layered-boolean

GOLDEN 1

Explanation

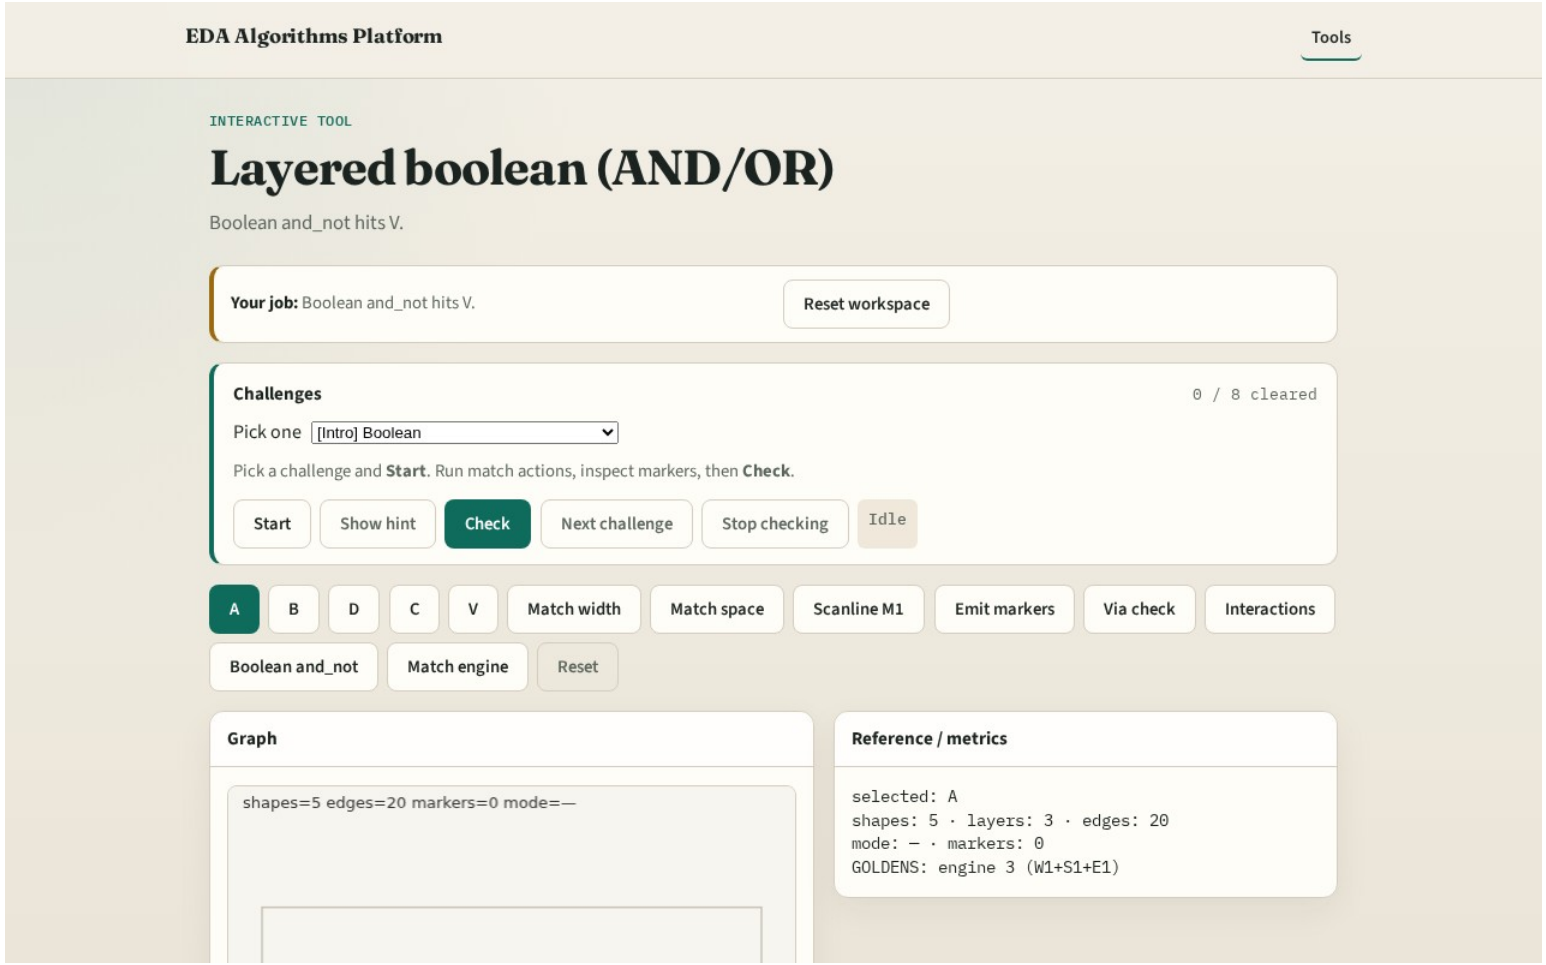

GOLDEN: one and_not hit on V.

- GOLDEN

```
n=1
```

Hit

Browser lab track

Browser lab starter

Implement track

- Call layered_boolean('and_not'); assert one hit on V

Pitfalls

- Confusing overlap with containment
- Swapping AND and AND-NOT

Your turn

- Next: full match engine pass
